

There are two ways to configure your Mercury altimeter's settings. Both methods give you access to the same settings, so it's just a matter of which is most convenient for you.

The easiest way is to setup your Mercury to connect to the internet via your WiFi networks or mobile hot spot on your phone. You can then use the Altimeter cloud for all configuration and automatic uploading of your flights.

Alternatively if you're in the field without internet access or you just want to use the device directly you can connect to the devices internal WiFi and webserver and configure it via this method instead.

Via the Altimeter Cloud

The easiest and recommended way. Configure your Mercury from any browser using the Altimeter Cloud website. Your altimeter just needs to be connected to WiFi and in WiFi mode.

Configure on the device

Connect directly to the Mercury's built in WiFi server and configure it from any device. No internet required — ideal for use in the field or if you don't have WiFi set up yet.
